

Neuro-Muscular Electrical Stimulation (NMES) for Dysphagia

VitalStim® Plus

Electrotherapy and sEMG Biofeedback System

Activate the Power to Swallow

Neuro-muscular electrical stimulation (NMES) is an evidence based treatment used for treating swallowing difficulties (dysphagia). The use of NMES with traditional dysphagia therapy re-educates and re-trains the muscles for swallowing . The VitalStim Plus with sEMG provides bio-feedback to the patient to monitor and see the improvement of the muscles for swallowing as well as screen mirroring technology to help increase the effort and duration of swallowing exercises. The VitalStim Plus machine projects live videos and images via Bluetooth technology onto a Tablet or Laptop screen. VitalStim Plus is the only form of NMES that is FDA approved from the USA.
